Get-Rescue — Requirement Coverage & Gap Analysis

Prepared 10 October 2026. Every requirement in the six shared PDFs, checked against the code.

Sources analysed: RESCUE Wireframe for CRM (RSR & TOW) v2; Zoho – Vendor Accounting; Ondemand Workflow for Invoicing; WhatsApp Flow; 2_LOGIC_REPAIR; 3_LOGIC_TOW; GetRescued_ETA_v1.

Method. Each point was checked against the widget source, the Custom API source and the field reference. Nothing is marked covered because a document or an earlier discussion says so. Where the evidence is in Zoho configuration rather than code — org settings, master-data completeness, Books tax setup — it is marked Needs Verification, because it cannot be confirmed from the repository.

One framing point that explains several gaps. The ETA sheet estimates Zoho FSM. The application was built in Zoho Creator. Everything works, but FSM-native capabilities — dispatch territory logic, the FSM mobile app's own tracking and status — had to be rebuilt as Creator widgets rather than configured. Items 5, 24 and parts of 26 are where that shows.

1. RESCUE Wireframe for CRM — Lead Flow & Tables

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
Agent logs into cloud telephony on CRM home	Wireframe p1	Telephony embedded in the agent's home page	Ozonetel agent portal embedded by iframe on the Dashboard page; Call Center widget on the same page	Fully Covered	—	Zoho blocks the reverse direction — Ozonetel cannot frame a Zoho page (X-Frame-Options), which is why the pop renders in our own page instead
Incoming call pop-up on the agent dashboard	Wireframe p1	Pop appears when a call arrives	`recordRingingCall` writes a RINGING row; the Call Center widget polls every 5s and opens the pop	Not Working as Expected	Re-paste `recordRingingCall.deluge` — the file had ~3,400 lines of pasted text inside the function and has not compiled since commit `ccded6c`	Repaired 9 Oct. Until it is re-pasted, no ring-time row is created and the pop cannot appear
Pop offers New Case / Old Case	Wireframe p1	Agent chooses between opening an existing ticket or creating a new one	Pop lists matching tickets with an **Open** button each, plus a **Create New Case** button	Partially Covered	The Old Case path lists tickets matched on the caller's number only. There is no search box for **Client Tracking ID** or **Vehicle Registration Number** inside the pop, which the wireframe asks for	Those searches exist on the main dashboard; the gap is that they are not in the pop itself
Link call to the ticket	Wireframe p1	The call is attached to the chosen or newly created ticket	Attached on Create Case and on Assign, through three signals (pop UCID, ticket UCID, recent unlinked call from the same number); manual **Link Call** button in the header	Not Working as Expected	Re-test. Three server-side APIs were attaching the call to an old case by phone number at ring time — removed 9 Oct	Was producing the reported RSID823004 mismatch. Fixed but not yet confirmed by the client
Website / WhatsApp tickets appear in Active Cases	Wireframe p1	Tickets created outside the call flow show in the same list	`serviceRequest` widget creates tickets with Lead_Source; all tickets share one dashboard	Partially Covered	WhatsApp-originated ticket creation is not built — only website-form creation is	The inbound WhatsApp webhook logs messages but does not create a ticket
Agent name updated when a web ticket is opened	Wireframe p1	Opening a web-created ticket records the agent	`Created_By_Agent_Email` is set on first save only, so it is not reattributed on open	Needs Verification	Confirm whether the client wants the opening agent recorded separately from the creating agent	Deliberate: set only on create so reopening does not reattribute
Seven master tables, all linked to Tickets	Wireframe p2	Vehicle Make, Vehicle Issue, Rate Mapping, Client, Vendor, Staff, Calls	All seven exist and are read by the app: Vehicle_Master, Vehicle_Issue, Rate_Master, Client, Vendors, Technicians/Agent, Call_Log	Partially Covered	`Rate_Master_Report` is a pattern-matched report name never confirmed live. If Suggested Rate ever returns blank, check this first	Staff is split across Agent and Technicians reports rather than one table

2. Wireframe — Actions 1 to 4 (Back-office)

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
Action 1 — Create Service Ticket fields	Wireframe p3	Name, Phone (10 digits), Alt Phone, Email, Client Type, Client ID, Vehicle, Reg. No., Breakdown Issue, Vehicle Status, Time of Service (NOW/LATER)	All present. NOW auto-saves current time + 30 min via `computeServiceTime()`	Fully Covered	—	Client is a real Lookup rather than a plain dropdown — an improvement, agreed earlier
Back-end autocreation	Wireframe p3	Case ID, Creation Time, Agent Name, Lead Source, Task Status	Case ID is `RSID` + last 6 digits of the record id; Lead_Source hardcoded to Call in this widget; status set per stage	Partially Covered	Case ID collision risk at high volume — 6 digits is not guaranteed unique	Accepted trade-off at the client's explicit request
Action 2 — fee calculation	Wireframe p4	Distance for Quote (TOW), Suggested Rate from rate mapping, Total Service Fee manual, Booking Fee manual, Remaining Fee auto	All five present and working; Suggested Rate is flat for RSR and formula-based for TOW	Fully Covered	—	Verified against the Rate Master logic
Action 2 — payment method default	Wireframe p4	Payment Gateway is the default; if changed, receipt photo becomes mandatory	Default was Cash; as of 8–9 Oct it is blank when the fee is zero or already paid, Cash otherwise	Partially Covered	The wireframe asks for **Payment Gateway** as the default. Ours is Cash	Changed twice at the client's request since. Worth confirming which default they now want
Action 2 — receipt photo mandatory unless PG	Wireframe p4	Mandatory when method is not Payment Gateway	Implemented, and now also waived when the booking fee is zero or the fee was settled through the gateway	Fully Covered	—	On-screen text states the rule in force
Action 2 — save navigation rules	Wireframe p4	Fee 0 → Location; fee > 0 & pending → Live Cases; fee > 0 & success → Location	Implemented through `quoteStatus()` and `canAdvance`	Fully Covered	—	—
Action 2 — two WhatsApp buttons	Wireframe p4	Send total fee link; send booking fee link	One combined button when a fee exists; Request Location when it does not	Partially Covered	The wireframe shows two separate sends (total fee, booking fee). Ours sends one combined message	Agreed at the time as a simplification; flag if the client wants both
Close Case available from Action 2 onward	Wireframe p4	A Close Case action on every page from Action 2	Permanent Close Case button in the wizard footer	Fully Covered	—	—
Action 3 — capture both locations	Wireframe p5	Breakdown and Drop as **Location field type**, manually editable, with WhatsApp link buttons	Captured as separate latitude/longitude text fields, filled by pasting a lat,long pair; WhatsApp link buttons present for both	Partially Covered	A real map/location picker is not built. The client called the paste mechanism an explicit temporary stand-in: "for now I will be putting up lat long like this manually"	Functionally equivalent; the UX differs from the wireframe
Action 3 — Location Received Time	Wireframe p5	Stamp the time the breakdown location arrives	`Location_Received_Time` stamped once, on first capture	Fully Covered	—	—
Action 4 — assignment filters	Wireframe p6	Filter by service issue, then 8 km RSR / 20 km TOW geofence, then sort by priority and distance	All three steps implemented, with a preferred-vendor override that shows every vendor	Fully Covered	—	—
Action 4 — popup columns	Wireframe p6	Priority, Name, Contact No, Distance, App Status, Login Status, Assign	All seven present. App Status and Login Status both read `Availability_Status`	Partially Covered	A genuine login/logout session log does not exist, so Login Status repeats App Status	Client decided on 26 Sep to use one field for both. Revisit only if a session log is wanted
Action 4 — multi-assign, first accept wins	Wireframe p6	Assign to several; first to accept takes it and it leaves the others' apps	Per-vendor Invites rows; accept writes the invite and the ticket; others lose it on their next poll	Not Working as Expected	Re-test with **two** vendors. A defect in matching a vendor to their invite row meant responses were never recorded on multi-vendor tickets	Fixed 9 Oct — the comparison used a display name Creator does not return

3. Wireframe — Actions 5 to 8 (Field apps)

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
Action 5 / 5a — Accept	Wireframe p7, p11	Capture accept time, GPS, ETA and distance to breakdown via Maps API	`Service_Acceptance/_For_Tow`, `RSP_Start_*`, `ETA/ETA_TOW`, `Distance_To_Breakdown/_TOW`, all on Google	Fully Covered	—	Field names differ from the newer distances spec — mapping proposed, unanswered
Action 5 / 5a — Reject	Wireframe p7, p11	Reason mandatory, capture reject time, copy to a Task Rejections table	Reason enforced; `Task_Rejections` row written with name, time and reason	Fully Covered	—	Reject now goes on that vendor's own invite, not the shared ticket
Odometer at start (TOW)	Wireframe p11	Number field, mandatory on accept	`Odometer_Reading` captured at accept	Fully Covered	—	—
Action 6 / 6a — Reached	Wireframe p8, p12	Capture reach time, roundtrip distance, mandatory geo-tagged photo with lat/long and time on the image	Reach time, `Reach_Location_*`, roundtrip legs, and a canvas watermark stamping GPS and timestamp onto the photo	Fully Covered	—	Odometer and Toll Charges captured for TOW
Action 6 / 6a — Cancel	Wireframe p8, p12	Reason mandatory, cancel time, cancel location, distance from start to cancel point	`Cancel_Reason`, `Cancellation_Time`, `Cancel_Location_*`, `Cancel_Distance`, `Distance_Cancel_To_Breakdown`	Fully Covered	—	Cancel-to-breakdown is straight-line, as the client later requested
Send ETA to customer (back-office only)	Wireframe p8	Button on the Reach page, agent only	**Send ETA to Customer** button on the agent Reach stages	Not Working as Expected	The ETA is sent as hours ("0.3"). The clock-time version is built but cannot go live until the WhatsApp template text is changed	Client confirmed they want "15:35 Hrs", which means no template change is needed — verify the full template wording first
Action 7 — WIP photos and fields	Wireframe p9	Pre-service 4/2 mandatory, post-service 4/2 mandatory, expense photos 2, Issue Resolved, Expense Amount	All present with enforced minimum counts	Fully Covered	—	—
Action 7 — voice note when unresolved	Wireframe p9	"Issue not resolved – add voice note?"	Not built	**Missing**	Audio capture, storage and playback. Not started	The wireframe itself phrases this as a question, so it may never have been agreed
Action 7 / 7a — Customer Reject	Wireframe p9, p13	Cx rejection reason mandatory; status → REMAINING FEE DUE	Implemented in both flows	Fully Covered	—	—
Action 7a — Vehicle Picked	Wireframe p13	Enabled only when drop location exists; capture pickup time, Drop ETA and Drop Distance	Guarded; `Pickup_Time`, `Return_Journey_ETA`, `Breakdown_To_Drop_Distance`, now measured from the stored Reach position	Fully Covered	—	Field names differ from the newer spec — mapping proposed
Action 7b — Reached Drop	Wireframe p14	Capture arrival time and RSP Drop Location; roundtrip RESCUE → breakdown → drop → RESCUE	`RSP_Drop_Latitude/Longitude` captured; roundtrip computed	Fully Covered	—	Drop photos, odometer and toll captured
Action 7c — Unloading & Handover	Wireframe p15	Unloaded 4, Handover 1, VCRF 1, handover name/number/designation, capture work complete time	All present and mandatory	Fully Covered	—	—
Action 8 — Final Payment	Wireframe p10	Collect amount display-only, method dropdown, QR for PG, receipt photo mandatory otherwise, Payment Received enabled only at zero or success	All implemented, including a QR block shown when the method is Payment Gateway	Fully Covered	—	The method no longer defaults to Cash — changed 26 Sep at the client's request
REASSIGN button on every RSR and TOW app page	Wireframe p7–p15 (repeated	Back-office can reassign from any field-app page	Not built anywhere — no reassign control exists	**Missing**	A reassign action on the agent-side copies of the field stages, returning the ticket to assignment and re-inviting	Repeated on nine wireframe pages, so it is not an aside. This is the single most-repeated missing item

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
	note)					

4. Wireframe — Final Closure & Other Pages

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
Final Closure — display blocks	Wireframe p16	Customer details, full service summary, fee collected with modes and photos, mechanic, all images	All present; the summary surfaces every field from every stage as an editable row	Fully Covered	—	Photos show presence, not thumbnails — Creator exposes no file URL
Final Closure — closure fields	Wireframe p16	Closure Status, reason, refund due/reason/amount, Cx feedback 1–10 and text, B2B GST required, GST number	All present	Fully Covered	—	—
Closure Status option list	Wireframe p16	Validation table names COMPLETED, CANCELLED BILLABLE, CANCELLED NOT BILLABLE, NOT CONVERTED	Options are Not Converted, Cancelled, Cancelled - Billable, Completed	Partially Covered	There is no literal **Cancelled Not Billable** value; plain **Cancelled** is being used for it	This inference matters for the vendor round-trip branch 4 just built. Confirm with the client
TSF validation formula	Wireframe p16	TSF = (BF + BALF) − (REFUNDBF + REFUNDBALF)	`computeClosureTSF()` = booking fee + remaining fee − refund, each fee counted only when confirmed paid	Partially Covered	The spec has **two** refund amounts (booking and balance); the app has one `Refund_Amount`	Arithmetically identical when only one refund is issued
Close Task pushes all data to the RESCUE backend	Wireframe p16	On close, send all case data to the Rescue back-end via API	`sendToAirtable()` is a stub that logs a warning and returns false	**Missing**	Airtable API key, base and table id, plus a Deluge proxy — the widget's CSP blocks a direct browser call	The call site already exists in `saveClosure()`, so wiring is isolated
Active Tasks sorted by status and timers	Wireframe p17	Live list sorted by STATUS and TIMERS	Four status buckets; elapsed times shown on invite rows but not as a sort key on the case list	Partially Covered	Sort within each bucket by age, and show a per-case timer	Status grouping is done; the timer dimension is not
Search closed tasks by four fields	Wireframe p17	Mobile number, Client Tracking ID, vehicle registration, Rescue ticket id	All four supported, including closed tickets hidden from the dashboard	Fully Covered	—	—
Case Details — closed tickets view-only	Wireframe p17	Closed cases can be viewed but not edited	`state.closureReadOnly` locks every step of a closed ticket in `getRescueTicket`	Partially Covered	The Kanban board has no equivalent lock — reopening a closed ticket there is still editable	Flagged as a known follow-up in the project log
Automated WhatsApp at each step	Wireframe p17	Customer updated at every step	13 sends implemented across both flows	Partially Covered	Two deviations, below in section 6	—
Integrations required	Wireframe p17	Telephony, website form, WhatsApp, Google distance, payment gateway, Airtable	Five of six built; Airtable is a stub	Partially Covered	Airtable	—

5. Zoho — Vendor Accounting

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
Level 1 — the seventeen listed fields	Vendor Accounting p2	Vendor ID, Case ID, Date, Status, Service, Vehicle, Base Fee, Travel Kms, Round-trip Kms, Kms Fee, Gross, Extras, Net, Cash Collected, Balance, Comments, Settlement status	All seventeen present on the Operations Approval screen, with Round-trip Kms, Extras and Comments editable exactly as the table specifies	Fully Covered	—	`Ops_Approval_Comments` is a Number field in Zoho and must be changed to Multi Line, or notes are rejected
KM Fee formula	Vendor Accounting p2	RSR and TOW slab formula with ROUNDUP	`computeVendorKmFee()` reproduces it; the worked example (1000/500/200/300) returns Gross 1500, Net 1700, Balance 1400 exactly	Fully Covered	—	Verified by running the live formula
Level 2 — settlement calculation	Vendor Accounting p3	Net Fee − TDS − Cash Collected, with batch date, UTR and amount paid	Implemented, with a real Zoho Books Bill and Vendor Payment. Worked example returns TDS 17 and Final Payable 1383 exactly	Fully Covered	—	TDS is per-vendor rather than a flat 1%, which handles vendors on different rates
GST payable / GST paid	Vendor Accounting p3	GST payable calculated if applicable from the vendor table; GST paid entered by Accounts	Built 26 Sep. 18% of Net Fee when the vendor has a GSTIN; GST Paid typed by Accounts and split proportionally	Fully Covered	—	Worked example returns ₹306
Vendors see payments in the Vendor Portal	Vendor Accounting p4	Vendors view recorded payments	Payments are recorded in Zoho Books; `vendorPerformance` shows aggregate stats only	Needs Verification	Confirm whether the Zoho Books vendor portal is enabled and shared with vendors	Nothing in the app blocks this — it is a Books configuration question
A vendor who collects more cash than their payout	— (found while testing)	Not covered by the PDF	`recordVendorPayment` rejects a negative Final Payable and writes nothing, so the batch cannot be settled	Not Working as Expected	A decision on how a vendor-owes-company balance is carried — typically to their next payment run	Not an edge case: any job where cash collected exceeds the payout hits it. Raise before the first live payment run
First live vendor payment run	Vendor Accounting	End-to-end payout through Zoho Books	Fully built; never executed against the live Books org	Needs Verification	One real payment run	The Books Bill/Vendor Payment path is researched but untested

6. Ondemand Workflow for Invoicing, and the WhatsApp flows

6.1 Invoicing

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
Trigger on ticket closed/completed	Invoicing p1	Invoice raised when the ticket closes	`maybeGenerateBooksInvoiceOnClosure()` runs from `saveClosure()`, plus a manual Generate Invoice button	Fully Covered	—	An earlier gap analysis of mine wrongly listed this as missing — it was built 14 Sep
Amount basis	Invoicing p1	Final amount for On Demand; Rescue Charges for other clients when above zero	`onDemandInvoiceEligibility()` implements exactly this split, plus Extra_Payable for On Demand	Fully Covered	—	—
Find or create the customer in Zoho Books	Invoicing p1	Customer resolved or created	Implemented by phone and email	Fully Covered	—	—
GST breakup and round off	Invoicing p1–2	Service charge = total × 100/118, CGST and SGST at 9%, round off as adjustment	`computeGstBreakup()` reproduces both worked examples to the paisa, including the ₹0.01 residue on ₹999	Fully Covered	—	The same function feeds the GST export, so they cannot disagree
Place of supply Karnataka	Invoicing p1	Default KA	`place_of_supply` set to KA	Fully Covered	—	—
Email invoice and return the number to the ticket	Invoicing p1	Invoice emailed; number written back	Invoice id and PDF written back; the PDF opens from the ticket	Not Working as Expected	An unresolved `payments_recorded: 0` issue means payments are not attaching to invoices	Needs a live invoice to debug against

6.2 WhatsApp — the thirteen sends

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
SENDS 3, 4, 5, 6, 7, 8, 10, 11, 12, 13	LOGIC_REPAIR / LOGIC_TOW	Each fires at its stated trigger	All ten implemented at the stated triggers, including the repair/tow branch on SEND 4	Fully Covered	—	SEND 12 is now gated on remaining fee above zero, per the sheets
SEND 1 → CONTINUE → SEND 2	LOGIC sheets, WhatsApp Flow	Send 1, then on the customer tapping CONTINUE send 2 and then 3	1, 2 and 3 go out in sequence; the CONTINUE gate is not implemented	Partially Covered	The inbound webhook records the CONTINUE but nothing waits on it	The client has offered to supply revised templates if this cannot be made to work. Needs a decision
SEND 9 five minutes after SEND 8	LOGIC sheets	Delay of five minutes	Sent immediately after SEND 8	Partially Covered	A scheduled Deluge function sweeping a due-time field — new Zoho infrastructure	A widget cannot hold a five-minute timer; the app is closed long before it fires
Inbound: customer location shared via WhatsApp	ETA #34, Wireframe p5	Parse a shared location pin and save it to the ticket	The inbound webhook logs messages but contains no location or latitude handling	**Missing**	Parse the location payload and write the coordinates onto the matched ticket	This is also why the breakdown location still has to be pasted by hand

7. GetRescued_ETA_v1 — the 38 estimated items

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
1 FSM org config	ETA #1	Org settings, roles, permissions, business hours	Roles and access are documented in ACCESS.md and enforced by Creator profiles	Needs Verification	Confirm business hours and holiday calendar exist in Zoho	Cannot be confirmed from the repository
2–4 Master data	ETA #2–4	Vehicle, Issue, Rate mapping, Client, Vendor, Staff, Calls tables	All read successfully by the app	Needs Verification	Confirm the vehicle master carries all India models and that every rate rule is populated	The structure is proven; completeness is not
5 Territory & pincode configuration	ETA #5	Bengaluru territories by pincode, mapped to technician pools	No pincode or territory concept exists anywhere in the codebase	**Missing**	Pincode-zone tables, pools per territory, and dispatch rules. 6–7 hrs estimated	The geo-fence radii (8 km / 20 km) are built — that part is done
6 Ticket lifecycle & status workflow	ETA #6	End-to-end status flow with CTA-tied transitions and branches	Sixteen-value picklist, every stage writes one, resume routing per status, all cancel/reject branches present	Fully Covered	—	—
7 Telephony & call pop	ETA #7	Pop, New/Old Case, search, link, calls table auto-updated	Built; see section 1 for the two open points	Partially Covered	Pop-level search by tracking id and vehicle number	—
8–12 Back-office action pages	ETA #8–12	Actions 1, 2, 3, Active Cases, Final Closure	All built	Fully Covered	—	See section 2 for the minor deviations
13 WhatsApp back-office notifications	ETA #13	Booking, payment links, location, ETA, completion, remaining fee	All built	Partially Covered	ETA format; CONTINUE gate	—
14–17 RSR field app	ETA #14–17	Accept/reject, reach/cancel, WIP, final payment	All built	Fully Covered	—	—
18–22 Towing field app	ETA #18–22	Accept/reject, reach/cancel, loading, reached drop, unloading	All built	Fully Covered	—	—
23 Assignment engine	ETA #23	Geo-fence and priority filtering, popup columns	Built	Partially Covered	Login Status is not a distinct signal	—
24 Real-time tracking & app status	ETA #24	GPS tracking, app/login status in the popup, map view for back-office	Heartbeat writes `Current_Latitude`/`Longitude` and `Location_Last_Updated_At`; both status columns render; Ops Map exists	Partially Covered	A genuine login/logout session log, if Login Status is to mean something different	Confirm the heartbeat is landing — have a vendor go online and check their Vendors_Report row
25 SLA timestamps & adherence	ETA #25	All key timestamps plus response and service time calculations	Every timestamp captured; SLA Adherence section added to Agent Performance (Avg Response, Avg Service)	Fully Covered	—	Verified against fabricated tickets with known answers
26 Dashboards & reports	ETA #26	Operational, financial, rejection analytics, Analytics reports, GST export	Agent and Vendor Performance, rejection log, Collections, Outstanding, Payment Modes, GST export all built	Partially Covered	Zoho Analytics cross-module reporting (FSM + Books combined) is not built	Everything else in this item is done
27–28 Books org, GST, customer & item master	ETA #27–28	Books org settings, GST rules, chart of accounts, service items	The app writes invoices successfully, which proves the org exists	Needs Verification	Confirm GST rates, chart of accounts and service items are configured as specified	Books-side configuration, not code
29 Invoice auto-creation & payment tracking	ETA #29	Auto invoice on closure, GST/B2C split, payment recording	Auto-trigger built; GST split built	Not Working as Expected	The `payments_recorded: 0` issue	—
30 Vendor payouts & expense management	ETA #30	Payouts, expense tracking, credit notes, refund processing	Payouts and expenses built; Extras and Expense Amount captured	Partially Covered	Credit notes and refund push to Books are not built — refund fields exist on closure but never reach Books	—
31 Finance dashboard & audit trail	ETA #31	Books-side dashboard, payment modes report, audit trail, sync back to FSM	Payment Modes report built in Agent Performance	**Missing**	A Books-side finance dashboard, audit trail, and any sync back from Books to the app	4–5 hrs estimated

Requirement / Point	Source	Expected Functionality	Current Implementation	Status	Missing Work / Required Changes	Remarks
32 Google Maps API	ETA #32	Distance and ETA at each relevant CTA	Built and deliberately scoped to the four calculations the client named	Fully Covered	—	Straight-line fallback everywhere else
33 Payment gateway	ETA #33	Links/QR, webhook, reconciliation, WhatsApp delivery	Zoho Payments links, QR, webhook and customer page all built	Partially Covered	Add “Payment Gateway” as an option on `Create_Case.Payment_Method`, or the webhook keeps dropping the method	—
34 WhatsApp Business API	ETA #34	Inbound location parsing and outbound notifications	Outbound complete; inbound webhook receives and logs	Partially Covered	Inbound location parsing	—
35 Website form	ETA #35	Form creates a case with Lead Source Web	`serviceRequest` widget built	Needs Verification	Confirm the live website form posts to it	—
36 Airtable / backend sync	ETA #36	Push all case data on close	Stub only	**Missing**	API key, base and table id, plus a Deluge proxy. 15–17 hrs estimated	The largest single unbuilt item
37–38 UAT	ETA #37–38	Internal QA then client UAT, with sign-off	Not started as a structured exercise	**Missing**	49–56 hrs estimated	The project has no automated tests; all validation so far has been client-reported defects

8. Summary

Status	Count	Items
Fully Covered	31	Both field apps end to end, all four back-office action pages, closure, status workflow, assignment filtering, distances and ETA, vendor accounting Levels 1 and 2 including GST, invoicing and the GST breakup, ten of the thirteen WhatsApp sends, SLA timestamps and adherence, search, Google Maps scoping
Partially Covered	18	Pop-level search; payment-method default; location picker; two fee-send buttons; Login Status; closure status list; TSF refund split; Active Cases timers; Kanban view-only lock; CONTINUE gate; SEND 9 delay; Books payment-method option; inbound WhatsApp; credit notes and refunds; Analytics reporting; master-data completeness; tracking; telephony search
Missing	8	REASSIGN button on all field-app pages; territory and pincode configuration; Airtable sync; inbound WhatsApp location parsing; voice note on WIP; Books finance dashboard and audit trail; sync back from Books; structured UAT
Not Working as Expected	6	`recordRingingCall` needs re-pasting; call linking and multi-vendor accept/reject both fixed 9 Oct but untested; customer ETA format blocked on the template; `payments_recorded: 0` on invoicing; negative Final Payable blocks a vendor batch
Needs Verification	9	Zoho org and business hours; master-data completeness; `Rate_Master_Report` name; Books GST and chart of accounts; live website form; vendor portal; heartbeat landing; agent-name-on-open rule; first live vendor payment run

Remaining work, by what it needs

Category	Items	Notes
Needs only a Zoho setting	3	"Payment Gateway" option on `Payment_Method`; `Ops_Approval_Comments` to Multi Line; `Locked_By`/`Locked_At` on the Agent_Ticket_Report layout
Needs a client decision	7	REASSIGN scope; closure status list; payment-method default; CONTINUE gate; Login Status meaning; vendor-owes-company handling; whether the WhatsApp template wording needs changing
Needs a credential or external account	3	Airtable key and schema; WhatsApp inbound configuration at WhatsPortal; Books vendor portal
Genuine build work	5	Territory and pincode (6–7 hrs); Airtable sync (15–17 hrs); Books finance dashboard (4–5 hrs); SEND 9 scheduled function; inbound location parsing
Testing	1	Structured QA and UAT, 49–56 hrs estimated — the largest remaining line item by effort

The honest headline: the build is close to complete, and the largest remaining item by effort is testing, not development. Of the eight missing items, only four are substantial builds; three of those are blocked on something outside the code.
